

## About Us

Idea Port Riga was founded three years ago in November 2007. At that time the company was just a team consisting of 5 people. Today the company is 50 people, strong and growing.

We don't claim to be the biggest, most prestigious or "leading" companies in the Baltics. What we do claim is that we offer quality services, we really care for our clients and the projects that we engage in and we provide one of the best places to work.

We are truly building a company that is able to compete on an international level, values professionalism and provides services that are of value to its customers.

# Applications integrations using SOA

In human life one of really difficult problems is communication, it's too often that miscommunications occurs and that people who are in the same room and speak one language don't understand each other, the same goes for computer systems – making IT systems “understand” each other, integrating them, is often viewed as crucial for effective organizations.

Every situation is unique and as consultants we are often called when the task is not at all trivial. For us this means always carefully analyzing the situation, talking with the client and together finding the optimal solution.

# BPEL based integrations

When we start an integration project that involves BPEL, we start our work from top (business processes and operations) down to the technical details like web services. This is a high level integration that tries to bridge the gap between pure technical solutions and business process descriptions.

But even better, BPEL allows you as a customer to do exactly the same, if you have skilled analysts, they can tune your changing business processes to be more up-to-date, without relying on expensive consultants.

Contact us if you want some BPEL based integration done or if you want to learn more and be able to do it yourself.

# Web services based integration

Reuse what your IT system do by introducing web services and service oriented architecture. We here are convinced (and can try and convince you if you want or help you convince someone else for that matter) that there's no point to duplicate services that are already present in the system. Web services can help expose and manage whatever functionality is already present and reuse this functionality across your enterprise.

It's like recycling in the information universe.

# Business Rules Engine

A world without rules would be a very chaotic world, don't you think? If you are just a little bit similar to most organizations you have a lot of things changing every day, this especially is true in how you react to information that the myriad of IT systems is gathering and flooding you with. Communicating and managing overhead for changing rules often results in error or ineffective speed of execution.

We help our clients define, automate and manage rules in their company. This completes the effective SOA integration package and gives much flexibility to adjust your organization behavior.

# Java based integration

For specific integration needs we can leverage the whole Java language suit and many years of integration projects experience to tailor the integration for you.

# ESB based integrations

“enterprise service bus (ESB) consists of a software architecture construct which provides fundamental services for complex architectures via an event-driven and standards-based messaging-engine (the bus). Developers typically implement an ESB using technologies found in a category of middleware infrastructure products, usually based on recognized standards.” - wikipedia  
For us this means working with Oracle Fusion middleware and providing quality services by using enterprise level integration platform. For you as a business stakeholder this means one huge leap towards SOA nirvana.
